

KEMA Academy

Knowledge in-depth and all round

With the introduction of market liberalization and internationalization, the need for increased profitability, risk management and production process optimization in the energy sector is now more urgent than ever. This urgency is amplified by discussions surrounding transition, uncertainty and evolving customer relationships. KEMA reaches out a helping hand to companies in the energy supply chain, offering a wide range of management and technical consulting services together with training, courses and workshops.

About KEMA Academy

Companies must have sufficient in-house knowledge for their production processes to run as optimally as possible. Yet it is very difficult to keep up with all of the latest developments. In many cases though, these developments hold the key to increased efficiency and enhanced reliability. The aging workforce is an issue of growing importance in the energy industry. Knowledge management is therefore universally recognized as being absolutely essential. Yet training on the job takes a great deal of time from on-site experts. KEMA has founded the KEMA Academy to relieve organizations from this burden. The Academy organizes a wide range of courses and workshops that cover the entire electricity and gas energy supply chains.

Customized in-company training

We organize many of our courses based on open enrollment, but can develop in-company and customized training sessions on request. The course can then, for example, deal with actual cases from your business operations, or future scenarios that you have sketched out. We are flexible in this.

Our trainers

Our experts have years of experience in the specialty field in which they train. Their knowledge and experience is constantly kept up to date as they are involved in projects everyday.

The course offering

The KEMA Academy program consists of training courses both at the technical and the management level. The courses therefore go into breadth as well as depth. We have divided the course offering into the following groups:

- > Management & general
- > Plant performance
- > Sustainable energy
- > Carbon & climate
- > Transmission & distribution
- > Power cable technology
- > Data communication
- > Gas quality & flow
- > Gas markets & policy
- > Gas infrastructure & transport
- > Sustainable gases & clean energy
- > Knowledge of standards
- > Internal auditing
- > Health care
- > Medical
- > Safety

Most of our courses are taught at least once a year, while others are organized upon request. In addition, KEMA also organizes – often in cooperation with other specialists – workshops and seminars based on current events and recent changes in the world around us. For a comprehensive overview of our training program, please visit www.kema.com/academy.
